Building an Eye

Images used: 1-1, 1-2, 1-3, 1-4

I. Retina

photoreceptors (rods + cones)
↓
ganglion cells
↓
optic nerve

II. Choroid - blood vessels
nutrients (our energy)

III. Sclera connective tissue
provides: skeleton of our eye

IV. Cornea connectiv tissue
transparent (to get light to retina)

V. Iris/Pupil
color part of the eye
regulate light (have muscles inside)

dim

bright

VI. Lens
focus the light
- behind iris

VII. Ciliary Body

Muscular tissues
relaxed: distence
contracts: accommodation

A. Uvea: iris, ciliary body, and choroid
↳ a lot of blood flow

VIII. Vitreous chamber

clear fluied inside
provide: nutrition + structure

IX. Anterior chamber (LABEL)

aqueous
provide cornea and lens with nutrition

X. Extraocular muscles

outside of the eye (6). Help to conduct the movement of the eye

6EOM

XI. Ocular adnexa – supporting structors

A. Conjunctiva

yelo

B. Eyelids

protection

C. Tear film

- supply oxygen to cornea
- provides moisture

Other Basic Concepts

I. Anatomic Directions

A. Anterior or ventral: toward the front
on the front

B. Posterior or dorsal: toward the back
on the back

C. Superior or rostral: toward the head

D. Inferior or caudal: away from the head
("cuddle - foot massage)

II. Anatomic Ocular Directions

A. Inner: vitread

B. Outer: sclerad
